

- Real life Data Mining assignment
- Your task: rank hotels on Expedia based on likelihood of booking
- Taken from Kaggle (DM competition website), dataset provided by Expedia

 How could we do this using Data Mining techniques? Do you have ideas?

#### Assignment 2: The data - search fields

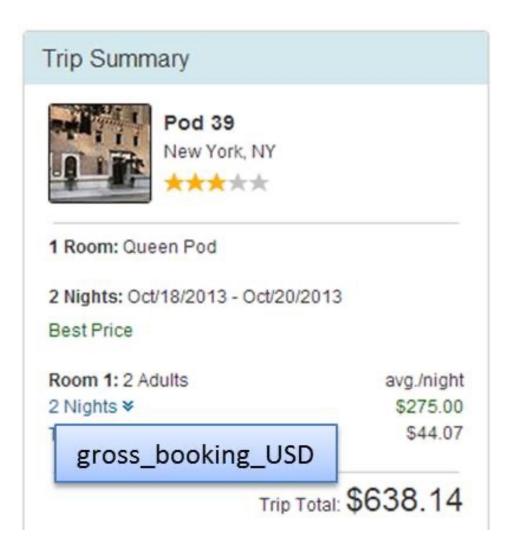

# Assignment 2: The data - resulting properties (more per search)

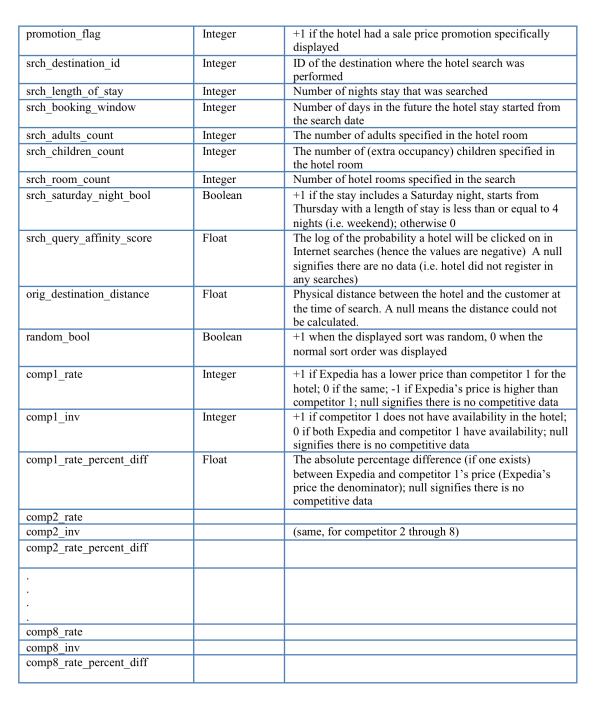

### Assignment 2: The data (booking)

1	/		VRIJE UNIVERSITEIT
_	· (	u	AMSTERDAM

Field	Data Type	Description
srch_id	Integer	The ID of the search
date_time	Date/time	Date and time of the search
site_id	Integer	ID of the Expedia point of sale (i.e. Expedia.com,
		Expedia.co.uk, Expedia.co.jp,)
visitor_location_country_id	Integer	The ID of the country the customer is located
visitor_hist_starrating	Float	The mean star rating of hotels the customer has
		previously purchased; null signifies there is no purchase history on the customer
visitor_hist_adr_usd	Float	The mean price per night (in US\$) of the hotels the
		customer has previously purchased; null signifies there is no purchase history on the customer
prop_country_id	Integer	The ID of the country the hotel is located in
prop id	Integer	The ID of the hotel
prop_starrating	Integer	The star rating of the hotel, from 1 to 5, in increments of 1. A 0 indicates the property has no stars, the star rating is not known or cannot be publicized.
prop_review_score	Float	The mean customer review score for the hotel on a scale out of 5, rounded to 0.5 increments. A 0 means there have been no reviews, null that the information is not available.
prop_brand_bool	Integer	+1 if the hotel is part of a major hotel chain; 0 if it is an independent hotel
prop_location_score1	Float	A (first) score outlining the desirability of a hotel's location
prop_location_score2	Float	A (second) score outlining the desirability of the hotel's location
prop_log_historical_price	Float	The logarithm of the mean price of the hotel over the last trading period. A 0 will occur if the hotel was not sold in that period.
price_usd	Float	Displayed price of the hotel for the given search. Note that different countries have different conventions regarding displaying taxes and fees and the value may be per night or for the whole stay

## For training data only...

position	Integer	Hotel position on Expedia's search results page. This is only provided for the training data, but not the test data.
click_bool	Boolean	1 if the user clicked on the property, 0 if not.
booking_bool	Boolean	1 if the user booked the property, 0 if not.
gross_booking_usd	Float	Total value of the transaction. This can differ from the price_usd due to taxes, fees, conventions on multiple day bookings and purchase of a room type other than the one shown in the search

- You should provide:
  - A ranking of hotels based on likelihood of booking
  - For each search you will get a number of hotels,
    and you should rank them using your algorithm
- Some initial questions:
  - Could you just use the data as it is, or should you combine multiple records?
  - What kind of algorithm could be suitable for this task?

- What is expected of you?
  - Prediction file with your answer (score counts 20%),
    via Kaggle 19/05 2024, 23:59
  - Final report (grading based on selected techniques, quality of evaluation, rationale, writing style and creativity) (score counts 80%) 24 May 2024, 23:59
    - Max 14 pages LNCS
  - Process report 24/05, 23:59
    - Who did what and why, how did the cooperation between group members go
    - can be used to differentiate grades
  - Presentation (top 3 and random 3) 22/05, 15.30-17.15
